

Actual Values of Wind and Solar Power Generation

Apart from the forecast the information on actual production from renewable energy sources is also of utmost importance for traders. Taking into account thousands of plants from numerous operators of which only a few make their production figures available the determination of such data is a real challenge. But EuroWind found a solution: our actual values of wind and solar power generation are derived from actual wind measurements from the German Weather Service and satellite-based global radiation data, respectively. You are always up-to-date with EuroWind, 24/7, in real time.

What do our actual values offer?

- Ground- and satellite-based computation in real time
- Time resolution: up to 15 minutes
- Up to 96 updates per day
- Published with a 3-minute delay (approx.)
- Actual values at different levels:
country, TSO, portfolio, grid-node
- Electronic data transmission, e. g. via (S)FTP,
SOAP web service or E-Mail
- Graphical web interface spotrenewables.com
