

Nowcasting of Wind and Solar Power

Precise and frequently updated forecasts are of utmost importance for direct marketers dealing with intraday markets at the power exchange. EuroWind has the suitable product for you! Based on the actual production values („Now“) of the wind or solar parks and on our certified SOWIE prediction („Forecasting“) a short-term forecast („Nowcasting“) of the oncoming six hours is computed. By this technique the temporal information gap between the publication of two model-based forecasts is closed and the forecast precision is enhanced.

What does our Nowcasting offer?

- Multi-model nowcasts on the basis of the renowned weather models ECMWF, ICON, UKMET, GFS
- Up to 96 Nowcasting updates per day
- Nowcasting horizon: up to 6 hours
- Time resolution: up to 15 minutes
- Nowcasting at metering point-, portfolio-, TSO- or country level
- Electronic data transmission, e. g. via (S)FTP, SOAP web service, API, or E-Mail
- Graphical web interface spotrenewables.com
